Project # 40449

Subject: **Response to WDNR Review of Site Investigation Report
Community Within the Corridor – East Block
2748 N. 32nd Street, Milwaukee, WI 53210
BRRTS #: 02-41-263675; FID #: 241025400**

Dear Ms. Pfeiffer:

The DNR reviewed the SIR for compliance with Wis. Admin. Code ch. NR 716 on December 22, 2021 and has requested a response. KSingh has included DNR's questions and comments below and responses in *italics* follow.

I. Source identification

Wis. Admin. Code § NR 716.01 states that the purpose of SI is to provide the information necessary to define the source(s) of contamination. Furthermore, Wis. Admin. Code § NR 716.07(1) requires that the history of the site or facility, including industrial land uses that may have been associated with one or more hazardous substance discharges, be evaluated.

A. Discuss the potential source(s) for the PAHs that were identified within the soil and groundwater.

PAHs are present due to leaking underground storage tanks (BRRTS #03-41-000793 (Jonas Construction – Closed LUST) and BRRTS #02-41-263675 (Formerly Wisconsin Industries Pension & Trust – Formerly Closed ERP), environmental deposition, and former industrial operations including the use of cutting oils on the property within the building. The locations of industrial operations were widespread within the building footprint.

B. Discuss the potential source(s) for the metals that were identified within the soil and groundwater.

Metals are present due to environmental deposition, the presence of railroad operations on the east side of the property, and former industrial operations including the use of cutting oils and metal plating operations within the building. The locations of industrial operations were widespread within the building footprint. Therefore, metals testing was widespread within the building footprint in accordance with the Site Investigation Work Plan.

C. Analysis of soil samples for PCBs was limited to select soil samples located outside of the building footprint. Discuss potential source(s) for the PCB contamination at this site.

PCBs were investigated relevant to the previous locations of transformers. Given that the floor of the building is concrete with limited drains, PCBs contamination was believed to be limited to open ground areas. Testing did not indicate acute concentrations of PCBs. Groundwater sampling can be performed from monitoring well MW-6 if there is a concern for groundwater contamination. Otherwise, a cap will be maintained over the site and there is not risk of direct contact.

The information regarding PCBs was provided to the WDNR in the Phase II Report. Based on site history and findings of the Phase II Report, a Site Investigation Work Plan was submitted to WDNR with a review fee. The WDNR reviewed the Site Investigation Work Plan in a letter dated May 18, 2021, and subsequently a telephone meeting was held on May 21, 2021. The Site Investigation Work Plan was resubmitted to WDNR on May 28, 2021 with limited PCBs testing at locations EB-B-19, EB-B-20, and EB-B-26. The WDNR had no response to Site Investigation Work Plan and the Site Investigation was implemented in accordance with the submitted plan.

II. Degree and extent of contamination in all affected media

Wis. Admin. Code § NR 716.11(3)(a) states the purpose of the field investigation is to determine the nature, degree and extent, both areal and vertical, of the hazardous substances or environmental pollution in all affected media.

A. Groundwater

- i. Monitoring well location EB-B-17/MW-1 has been dry since it was installed on May 5, 2021. TCE greater than its industrial direct contact RCL was identified from 16-18 feet below ground surface at this location. To better define the extent and degree of contamination at this location, install a replacement groundwater monitoring well near EB-B-17/MW-1.

Groundwater contamination in the vicinity of EB-B-17/MW-1 has been historically delineated by a combination of monitoring wells GTS-33W, MW-1R, MW-3, MW-3S, MW-5, and MW-8 performed as part of the investigation of the Wisconsin Pension Plan and Trust project. Contamination in that vicinity is residual related to the former USTs and the extent and degree of contamination has already been defined and determined to be stable and/or declining. In addition, groundwater quality on the west block does not show impacts related to the northern courtyard. We do not believe that further investigation is warranted in that area as that area borders the roadway and there is no unidentified source of contamination in the roadway. The concerns related to the project were in the southern portion of the property in industrial areas as described in the Site Investigation Work Plan.

- ii. To help to define the extent and degree of groundwater contamination at this site, install Wis. Admin. Code ch. NR-141 compliant monitoring wells or piezometers that are screened immediately above the bedrock surface within the central courtyard's loading dock area and within the southern courtyard's paved driveway area. Should you encounter a shallow/perched groundwater table at these locations, then also

install nested monitoring well(s) that are screened within this shallow interval. Groundwater samples from these locations should be lab analyzed for VOCs, PAHs, metals and PCBs.

We are unclear on the location of this description of locations and will need to discuss further. However, there is no evidence of groundwater contamination related to industrial operations on the site, only in the vicinity of the historic USTs. As such, we do not see the need for additional monitoring wells at this time when monitoring wells MW-4R, MW-5, and MW-6 do not indicate groundwater contamination is present. However, we are willing to include PCBs in future groundwater sampling in MW-4R, MW-5, and MW-6 if that will assuage DNR concerns.

- iii. Based on the historical Briggs & Stratton manufacturing activities and associated metal plating operations along with the detection of per- and poly-fluoroalkyl substances (PFAS) in soil, collect and analyze groundwater samples for PFAS at sample location MW-6 and from the above-requested monitoring wells within the central and southern courtyards.

PFAs results were reported to WDNR as part of the Phase II ESA and soil sampling for PFAs was included in the Site Investigation Work Plan which was submitted on May 28, 2021. No PFAs were detected in soil samples within the industrial areas of the building from EB-B-27, EB-B-29, EB-B-30, EB-B-31, and EB-B-32. Soil boring EB-B-28 contains PFOA at 0.063 ug/kg and PFOS at 0.10 ug/kg. However, there are no Groundwater Protection RCLs for PFAs. Given that there is approximately 20 feet to groundwater under the building and PFAs contamination is limited and not expected to be below 4 feet, we believe that without a Groundwater Protection RCL being exceeded there is no reason to sample groundwater for PFAs at this time.

- iv. Soil contaminated with 1,1,1-Trichloroethane (1,1,1-TCA) greater than its groundwater pathway RCL was identified at sample locations EB-B-18/MW-2, B-8/TW-3 and VE-2. 1,4-dioxane is an emerging contaminant that is considered a co-contaminant with 1,1,1-TCA along with TCE, which was identified within soil throughout the entire site. Collect and analyze groundwater samples for 1,4-dioxane.

Future groundwater sampling events will include 1,4-dioxane in sampling from MW-2.

- v. Provide a more detailed discussion on how the groundwater contamination identified in the historical SI relates to the groundwater contamination identified in the current SI. More specifically, discuss how the concentrations have varied over time and what this means for the fate and transport of the identified contamination.

A brief comparison of the former chemicals of concern from the former BRRTS #: 03-41-000793 (Jonas Construction – Closed LUST) was performed of the historic MW-2 and the current MW-2 which are/were installed in the same general area within the northern courtyard. The current MW-2 was tested in 2021. The table following shows the relationship between then and now.

Well ID:	Former MW-2	Former MW-2	Current MW-2	
Chemical Parameters	Former Range 2003-2006 (ug/l)	Average 2003-2006 (ug/l)	Newer 2021 (ug/l)	Difference
Tetrachloroethene	<1.0 to <12.5	<5.2	1	Same
Trichloroethene	2.9 to 7.6	4.5	11	Higher
Cis-1,2-Dichloroethene	8.65 to 822	193.1	66	Lower
Benzene	1.59 to 292	78	57	Lower
Ethylbenzene	<6.0 to 118	50.3	160	Higher
Trimethylbenzene	37.9 to 793	196	500	Higher
Naphthalene	<160 to 22	16.3	31	Higher

The comparison demonstrates a mix (decreasing/increasing/same) within the data from MW-2. However, the test results are comparable to historic concentrations and there is no evidence of a new release or significant increase in groundwater risk. Therefore, we conclude that there has been no change in conditions for groundwater which was determined to be delineated in the past.

B. Soil

- i. Collect soil sample(s) from the replacement well/boring near EB-B-17/MW-1 to help to define the extent and degree of soil contamination at this location. More specifically, collect a deeper soil sample to help to vertically define the soil contamination. Considering the data collected from this sample location, discuss whether the soil contamination may extend off-site.

Historic soil samples from MW-3, MW-3S, and GTS-8 in the vicinity have already delineated the extent of soil contamination to be within the site boundary and related to the former USTs which have already been determined to be delineated. No additional soil sampling is proposed in that vicinity.

- ii. To help to define the extent and degree of soil contamination at this site, collect soil sample(s) from within the additional monitoring well locations requested above. These soil samples should be lab analyzed for VOCs, PAHs, metals and PCBs.

No additional monitoring wells are proposed based on the determination that groundwater contamination has been previously delineated related to the former USTs and no NR 140 ES exceedances are present related to industrial operations.

- iii. Soil contaminated with TCE greater than its industrial direct contact RCL was identified at sample location EB-B-29, which is located adjacent to the 32nd St. right-of-way (ROW). If access allows, collect soil sample(s) immediately adjacent to historical lateral(s) extending to/from the building near EB-B-29. The soil samples should be collected at a similar depth as the laterals. If access does not allow, ensure that confirmation samples are collected along the western edge of the hot spot soil excavation that is underway near EB-B-29. Based on the results of this additional investigation, discuss whether TCE soil contamination may extend into the 32nd St.

ROW.

Given the proximity of the building to the property boundary, it is assumed that there is limited contamination in the right-of-way. Access is not allowed due to difficult drilling conditions and presence of utilities. An evaluation of residual contamination related to the hotspot will be included in the Remedial Action Documentation Report. No contamination has migrated to the West Block. Due to the depth of bedrock, which is significantly deeper than utilities, contamination is not migrating via groundwater and preferential pathways. Air sampling of the sewer is proposed to determine if the utilities are a migratory pathway.

- iv. Provide a more detailed discussion on how the soil contamination identified in the historical SI relates to the soil contamination identified in the current SI. More specifically, discuss how the concentrations have varied over time and what this means for the fate and transport of the contamination.

Soil contamination is separated between the USTs and industrial operations on the property. The soil contamination near the northern courtyard and under surrounding buildings is related to USTs. Any variation in concentrations between the historic investigation and current investigation is purely due to variations in locations as there have been no industrial operations or UST operations since the historic investigation.

Soil contamination principally under the buildings is related to historic industrial operations due to the basement depth.

C. Vapor

- i. An indoor air sampling program will be required following the installation of the vapor mitigation/extraction system and after the interior construction is completed and HVAC systems are operational. Indoor air samples must also be collected from the basements throughout the building. The indoor air sampling results should be included within the commissioning plan, as discussed in the next steps outlined below.

A commissioning plan will be prepared following the performance of a Pilot Test

III. Evaluation of potential pathways for migration of contamination

Wis. Admin. Code § NR 716.11(5)(a) states that field investigation must include an evaluation of the potential pathways for migration of the contamination, including drainage improvements, utility corridors, sediments, bedrock and permeable material or soil along which vapors, free product or contaminated water may flow.

A. Utility corridors

- i. Additional investigation is required to delineate the vapor impacts identified within the sanitary sewer laterals and main sanitary sewer to assess this conduit as a potential migration pathway for contamination.
- I. Collect a second round of air samples from the sanitary manhole sample locations IA-1, IA-2 and IA-3.

Vapor samples will be collected from sanitary cleanouts IA-1, IA-2, and IA-3, and the results reported to WDNR.

- II. Collect an air sample from one sanitary sewer manhole located upgradient of the site and from two sanitary sewer manholes that are both located downgradient of the site, within the appropriate ROW(s). Discuss the results and whether any offsite properties may be impacted by the vapor contamination within this conduit. Provide a work plan, as needed, to address potential off-site contamination.

Air samples will be collected from the 3 sanitary sewer manholes and the results will be reported to WDNR. A work plan will be prepared, as needed, based on the test results.

- ii. Provide a map clearly highlighting the historical/existing laterals, where they are connected to the sewer and/or storm water mains, and the flow direction of the individual main utility lines. Place any vapor sampling results on the map, as appropriate. Indicate the depth of the historic laterals.

Laterals are already shown on Figure 2 of the SIR. KSingh has updated Figure 2 accordingly with color coded laterals to make it clearer to WDNR. The updated Figure 2 is included in Attachment A. The sanitary sewer and water lateral are the deepest utilities and extend under basement depths and are therefore potential migratory pathways. Other utilities are too shallow to be migratory pathways. All utilities are above the water table and unlikely to function as preferential pathways.

- iii. The Phase II Site Investigation Report, dated May 2002, submitted for the Jonas Construction site (BRRTS # 02-41-000793), which is located at the subject property, indicates that there is/was a storm sewer that transects the contamination identified in the northern courtyard of the property. Discuss whether this storm sewer lateral still exists and whether it acts as a preferential pathway for off-site migration of contamination. Display this on the map requested above, as applicable.

The storm sewer has not been identified in the field in current investigation of this project. A storm sewer which takes roof drainage flows south between 1 and 3 feet below ground surface along the west side of Addition 6 where it ties into a west flowing storm sewer line under the sidewalk north of Building 2A. The storm sewer can be seen on Figure 3. However, given the shallow nature of storm sewers on the project, it is not believed to be a preferential pathway as groundwater is much lower than utilities. Surficial runoff from the northern courtyard flows to the storm sewers in North 32nd Street.

B. Bedrock

- i. Discuss whether the bedrock that was identified at this site may be acting as a preferential pathway for migration of contamination. Justify your response.

We have identified no deep contamination in close proximity to bedrock. Contamination related to the USTs is principally shallow. Groundwater sampling under the building, MW-6, indicates that there is approximately 20 feet to the water table and the water table in closer proximity to

bedrock does not have NR 140 ES exceedances. Soil samples was performed at depth in accordance with the Site Investigation Work Plan and does not indicate deeper migration of contamination. Therefore, we conclude that bedrock is not being utilized as a preferential pathway as there is no contamination in contact with bedrock.

C. Other building features

- i. The Briggs and Stratton Industrial Campus - HISTORIC PRESERVATION CERTIFICATION APPLICATION PART 1 – EVALUATION OF SIGNIFICANCE provided in Appendix B of the SIR, indicates that a tunnel may exist under the north end of the boiler room extending to the basement of Building 1B. Discuss whether the tunnel still exists, and, if so, how it will be abandoned.

There is no tunnel currently connecting building 1B to the boiler room. Building 1B is connected at basement level to the boiler room.

- ii. The 1910 Sanborn Map (Last Updated 1926) provided in Appendix B of the SIR, shows what appears to be a tunnel under central courtyard. Discuss whether the tunnel still exists, and, if so, how it will be abandoned.

There is a tunnel under the central courtyard which isn't visible on figures as it is directly under the skywalk. The tunnel has been sealed on the south end. The tunnel will be used for storage of maintenance supplies and will open at the north end in the ventilated garage. The tunnel is too narrow for construction of a trench system. Indoor air testing will be conducted in the tunnel as part of commissioning. Photographs of the tunnel and a related plan sheet are included in Attachment B.

- iii. Indicate whether any sumps were identified during the SI. The historical contamination figures provided in Appendices D and E of the SIR show "old pits with debris" and sumps. If sumps do exist at the site, provide a sampling plan for these sumps to help to further define the extent and degree of groundwater contamination and to help to determine whether these sumps or pits are acting as preferential migration pathways for vapor contamination to enter the building.

The only sumps currently present on site are in elevator pits. As there are currently no NR 140 ES exceedances near elevator pits within the building, we conclude that there is no groundwater contamination risks associated with these sumps. In addition, the elevator pits will be sealed to act as vapor barriers and will not pose vapor migration risks.

IV. Documentation

- A. Provide soil figure(s) that display RCL exceedance lines for all suites of contaminants identified at this site (i.e., CVOCs, PVOCs, PAHs, metals, and PCBs) to help to present the extent and degree of all soil contamination.

Please find updated soil figures included in Attachment C.

- B. Figure 3 shows select historical soil probe and monitoring well locations. This figure should be updated to show all historical locations. Alternatively, these locations may be provided on a

separate figure.

An updated Figure 3 is included in Attachment D.

C. Figure 3 shows the approximate location of the UST that was unearthed in the southern courtyard during redevelopment activities. The DNR understands that there may have been another UST unearthed in the central courtyard. Clarify the location, amount and type of USTs that were unearthed during current redevelopment activities and display the locations of these USTs on Figure 3. Provide any tank system site assessment (TSSA) reports/data that may have been collected and discuss whether any contamination associated with these USTs has been discovered.

A Tank System Site Assessment is being prepared to the UST. Test results indicate that principally Toluene is found around the former UST with CVOCs encountered in depth in bottom sample. It is believed the CVOCs are associated with industrial operations, not the UST. TSSA data is included in Attachment E.

V. Other

A. Historic Fill Exemption

- i. Based on the presence and degree of solid waste materials (i.e., foundry sand, asphalt, brick and cinders) identified within the boring logs for the site, a "historic fill exemption", per Wis. Admin. Code § NR 506.085, is required for excavation/removal of the site cover and/or buried waste materials.

KSingh does not concur that solid waste materials are prevalent on the former industrial property. In particular, the excavation work is principally under the footprint of an existing building and the connection of utilities. Construction work consists primarily of remodeling and excavation, not in construction of new facilities. However, as it has been requested, an Historic Fill Exemption application will be prepared.

Please contact us if you have any questions.

Sincerely,

The test results in this report meet all 2003 NELAC, 2009 TNI, and 2016 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Comments

No additional comments.

Receipt

The samples were received on 12/11/2021 12:40 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 3.1° C.

GC/MS VOA

Method 8260B: The laboratory control sample (LCS) for 633267 recovered outside control limits for 4 compounds. This is a prepped 5035 LCS. All daily instrument LCSs were acceptable to continue with analyses, and the data have been reported. 1. South Bottom, 15' (500-209658-1), 2. North Bottom, 14' (500-209658-2), 3. East Wall, South 6' (500-209658-3), 4. East Wall, North 6' (500-209658-4), 5. North Wall, 5' (500-209658-5), 6. West Wall, North, 4' (500-209658-6), 7. West Wall, South, 8' (500-209658-7) and 8. South Wall, 7' (500-209658-8)

Method 8260B: The laboratory control sample (LCS) for 634198 recovered outside control limits for the following analytes: Chloromethane, 2,2-Dichloropropane, and 1,1,1-Trichloroethane. These analytes were not detected in the associated samples; therefore, the data have been reported. (LB3 500-633267/21-A) and (LCS 500-633267/22-A)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
*-	LCS and/or LCSD is outside acceptance limits, low biased.
*+	LCS and/or LCSD is outside acceptance limits, high biased.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation These commonly used abbreviations may or may not be present in this report.

□	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count
